High-Tech Views from Lady Liberty's Perspective

February 13, 2012

The Statue of Liberty remains one of the most recognizable landmarks in the world, with millions traveling to New York every year to visit Lady Liberty. For those not able to physically make the journey, they can turn to EarthCam for the ultimate viewing experience. As part of the 125th anniversary celebrations, EarthCam gifted the Statue of Liberty with 5 high-tech webcams. Installed on the famous golden torch, this collection of unique cameras invite viewers to experience a one-of-a-kind look from a part of the Statue that has been closed off to the public since 1916.

The technology powering these webcams comes in the form of EarthCam's new line of 16 megapixel construction cameras. Available in robotic and fixed position versions, these webcam solutions are designed for professionals seeking superior quality remote documentation for small to large scale projects. The cutting-edge systems are programmed to automatically capture large 4,928 x 3,264 pixel inspection-grade images continuously 24/7. A wide screen live streaming video preview allows users to quickly take on-demand

snapshots of their project remotely at any time. Unique to the systems is the ability to capture wide-angle and tall portrait views, and without the blurry edges typically found on lower quality webcams. The robotic version will also pan the entire jobsite, capturing numerous HD images and will automatically stitch them together into an impressive 700 megapixel panorama. Housed in a thermostatically-regulated, corrosion-resistant black enclosure, the inclusion of a maintenance-free wiper ensures optimal image clarity.

Years of hard work and innovation went into the concept and creation of these webcams, but EarthCam's job is far from over. Powered by EarthCam's Control Center software, these cameras are constantly monitored, ensuring that they remain online in order to deliver unmatched views from the Statue for the world to enjoy.
